

Agenda

- Working with 2 Matrices
 - Indexing
 - Slicing
 - Fancy Indexing (masking)
 - Transpose
- Aggregate Functions : sum, min, max, count
mean, std
- Logical Ops in numpy
 - Any
 - All
 - where
- Use-Case : Fitness data Analysis

Working with 2D Matrices

① using np.array to convert 2D List into numpy array

② Using reshape on 1D array

0, 1, 2, 3
4, 5, 6, 7
.. ..

indexing

③

$a = \begin{bmatrix} \square & \square & \square & \square & \square & \square \end{bmatrix}$

$a[0]$ \nearrow $a[1]$ \nearrow $a[2]$ \nearrow

$\begin{bmatrix} \square & \square a[0][0] \text{ , } a[0][1] \text{ - - - - - } \square \end{bmatrix}$
 $\begin{bmatrix} \square & \square a[1][0] \text{ , } a[1][1] \text{ - - - - - } \square \end{bmatrix}$
 $\begin{bmatrix} \square & \square a[2][0] \text{ , } a[2][1] \text{ - - - - - } \square \end{bmatrix}$

Aggregate Functions

* For each row \rightarrow axis = 1

* For each col \rightarrow axis = 0

Logical Ops

any : Check if any of the condition evals to True
 \rightarrow return True

all : all condition must satisfy
 \rightarrow return True

* where (condition, ^{optional} [x, y])

x: if condition is True
replace with x

y: else y
